How Populations Evolve Review Packet 13.7

Populations are the units of evolution. A population is a group of individuals of the same species living in the same place at the same time. Evolution is the change in heritable traits in a population over generations.

Populations may be isolated from one another (with little interbreeding), or individuals within populations may interbreed. Chapter 13 How Populations Evolve -

Los Angeles Mission ... The population of dogs is 575 because there are a total of 1150 alleles. The frequency of the two alleles is .22 and .78. Large population. No gene flow. No mutation. Random mating.

No natural selection Description A large population limits chance fluctuation. Individuals moving into or out of populations add or remove alleles from the gene pool ... Chapter 13: How Populations Evolve - mixes the gene pools of those populations (preventing genetic divergence) - can introduce new alleles into populations (i.e., an individual from population 1 travels to another population [population 2] and mates, introducing alleles from population 1 to population 2, some of which may be alleles new to population 2) BIOLOGY | HOW POPULATIONS EVOLVE | EXAM 4 REVIEW ... How will the population evolve over the next few generations? Use the terms natural selection, fitness, survival, and reproduction in your response.

Over time natural selection will occur (directional selection). There must be variation in the population to begin with in stem length. Topic #1: Evolution Basics & Types of Natural Selection A population is a group of individuals that can all interbreed, often distinguished as a species. Because these individuals can share genes and pass on combinations of genes to the next generation, the collection of these genes is called a gene pool. The process of evolution occurs only in populations and not in individuals. A single individual cannot evolve alone; evolution is the process of changing the gene frequencies within a gene pool.
